**Use Your Apple iPhone™ & Apple iPod touch® To  
Text Message (SMS) Large Groups Of Contacts!**

“TextGroups” fulfills A Void By Frustrated Consumers!

Jonathan Teboul, the developer behind other desirable Apps such as ContactsP has released his latest innovation to the App Store in the form of TextGroups. With TextGroups you have the ability to send text messages to a large number of recipients without having to add contacts one-by-one using the built-in “Messages” application, which has been the default, albeit limited, method of communication with groups of relationships.

With TextGroups in the palm of your hand you not only have the option to create, rename, organize and delete groups of contacts on your mobile device, you also have the ability to quickly and efficiently distribute information on-the-go: With TextGroups it has never been easier to send a greeting, a personal message or other important information and updates to multiple recipients simultaneously.

TextGroups is available in two versions for your Apple iPhone™ and Apple iPod touch®. Both versions include an identical set of features, and the difference lies within the fact that while the paid version features no “in-app” advertisements, the free version is sponsored by banners.

TextGroups (paid) On The App Store:
